Subject: Pharmacology

Abstract

Crude aqueous bark extract of *Cinnamon loureiroi* was evaluated for counter irritant activity. Irritation was induced by the clockwise frictional movement of fine sand paper to the ear of rabbits of average 1.5 kg body weight. The counter-irritant activity was determined by calculating the mean decrease in redness and erythema with those of control. cinnamon extract (25, 50, 75, 100 \( \mu \)g / 10 ml) showed counter irritant when compared with standard drug dexamethasone. All the extracts, showed the counter irritant activity. Highest (91.97 % inhibition) and the lowest (41.39 % inhibition) respectively.

Keywords: Counter irritant, *Cinnamon loureiroi*, rabbit’s skin, dexamethasone.

Introduction

Skin irritation is known as “the production of reversible damage of the skin following the application of a test substance for up to 4 hours” (OECD, 1981). Pathological characteristics and manifestation of skin irritation such as, Erythema and edema are manifestations of dermal irritation. Irritation is initially manifest by redness (erythema), vesicles, serous exudates, serous scabs (eschar) and various degrees of swelling (edema). Over time, other reactions may be manifest, like small areas of scaling, hyperplasia, hyperkeratosis and alopecia. Histopathology is useful in discerning among responses. In most cases inflammation is well developed within the first 72 hours of observation. (Gallegos et al., 2006)

*Cinnamon loureiroi* use as medicine is thousand years old mentioned in several books of the Bible and in the histories of ancient Rome and Egypt as well as medieval Europe (Keith Singletary, 2008). Ayurvedic and folklorik uses are, wound healing, flatulence, erectile dysfunction, conjunctivitis, leukorrhea, vaginitis, rheumatism, neuralgia, aphrodisiac, anti allergy, antifungal, insecticidal, antipyretic, analgesic, antiulserant, nematocidal (www.naturalstandard.com; Das et al., 2013). Its historical uses were, anti diabetic (Qin et al., 2003; Kim et al., 2006) anticancer (Schoene et al., 2005 ) antimicrobial (Sing et al., 2007) anti inflammatory (Kim et al., 2007) blood pressure lowering (Preuss et al., 2007) cholesterol lowering (Khan et al., 2003) antidiarrheal, cough, sore throat, indigestion, chest congestion, abdominal pain, headache (waris et al., 2003). tooth ache (Archer, 1998) medication resistant yeast infections (www.herbwisdom.com). Smelling of cinnamon enhances cognitive function and memory (Palmer et al., 1998). prevention of cardiovascular diseases, carcinogenesis, atherosclerosis (Srinivasan, 2005) vomiting (Khan et al., 2014)

Material and Method

Material

Chemicals

Dexamethazone sod. Was purchased from Ethical laboratories (Pvt) Ltd. Pakistan and *Cinnamon loureiroi* was purchased from local market of Multan, Pakistan.

Animals

Rabbits of either sex with the average weight of 1.5 kg was purchased from Animal market Hussain Agahi Multan, After 1 hr observing the normal dermatological and allergic behaviour, the counter
irritant activity was evaluated. All the rabbits were kept under laboratory conditions at room temperature with 12h light and dark cycles. All animal experiments were carried out in accordance with the acts of the Animal Ethical Committee of Baha-uddin zakariya university, Multan, Pakistan.

**Method**

**Collection of Plant Materials**

Indigenous medicinal plant *Cinnamon loureiroi*, known by a local name of “Dal chinni”. The plant were collected from the local market of Multan, Pakistan. The plant material was authenticated by expert taxonomist, Professor Dr. Altaf Dasti at the Institute of Pure and Applied Biology, Bahauddin Zakariya University, Multan, Pakistan.

**Crude extract**

The plant material was made free from foreign adulterants and vegetative debris by hand picking. Special electrical herbal Grinder was used to form coarse powder. Uniform dark brown powder was obtained with characteristic smell. Powdered *Cinnamon loureiroi* dissolved in distilled water, fluid obtained was filtered through Whatman-1 Filter paper (Horborn, 1971).

**Counter- irritancy assay**

Assay for counter irritant effect of aqueous bark extract of *Cinnamon loureiroi*, was performed with some specified modifications in assay described by Syed Saeed ul Hassan et al. (2013). Sand paper with fine particles was used to irritate inner surface of rabbit’s ear in clockwise direction for 10 minutes. Irritation, redness and erythema were produced in area of 2.0 cm² in diameter. 100 µl solution from each concentration of *Cinnamon loureiroi* and dexamethason (Standard) was applied to the irritated area. Distilled water treated ear was used as control. Ears were examined for intensity of erythema. A group of 3 rabbits for each was used while performing main assay by increasing concentration of irritants. Rabbits were examined after every 10 minutes. The numbers of ear showing decreased irritancy, redness and erythema were observed and recorded. The previous authors used control and test extract but not the effect of standared drug comparison. The time, dose and degree of counter irritancy was missing which is provided in this assay.

**Phytochemical Study**

The crude plant extracts were initially screened qualitatively with different organic solvents and reagents to detect the presence of some phytochemicals classes (Tona et al., 1998).

**Toxicity Study**

*Cinnamon* is used as a spice in food material in Asia so its safety is quite obvious. Budavari et al.(1989) have reported acute toxicity of *Cinnamon* in the animals is very low i.e. Benzaldehyde (LD50 orally, 1300 mg/kg rat), cinnamaldehyde (LD50 orally, 2220 mg/kg rat), linalool (LD50 orally, 2790 mg/kg rat), and salicylaldehyde (LD50 orally, 520 mg/kg rat)

**Statistical analysis**

**Results**

Preliminary phytochemical screening detected presence of tannins, phenols, saponins alkaloid, anthraquinones and coumarins as constituents of the crude aqueous bark extract of *Cinnamon loureiroi*, (Cl.Cr).

Discussion
Positive results are connected to the presence of tannins and saponins in the *Cinnamon*. On local application, the tannins act as astringents, healing, anti-irritative, anti-inflammatory antiseptic, anesthetic and antioxidant. Tannins form complexes with the proteins from the superficial layers of the skin, leading to the formation of a protective layer of protein-tannins. Moreover, the tannins act as antiseptics through the precipitation of the proteins from the membrane of the microorganisms and anti-inflammatory through the inhibition of the synthesis of prostaglandins and the freeing of the placenta activating factor (PAF) (Mahesh et al., 2008). Saponins, which from a structural point of view are glycosides, have an antiseptic and antimicrobial action, in a non-harmful way for the neighboring cellular tissues. The specialty literature draws attention to. Flavonoic derivates develop anti-inflammatory effects (mainly by inhibiting the freeing of lisosomal enzymes and reducing the level of oxygen–reactive species) (Casadevall et al., 2001), anti–allergic effects (by inhibiting the classical way the seric complement is activated), anti-microbial, capillary-protective and antioxidant.

Acknowledgement
Authors are thankful to Dr.Khaild Hussain Janbaz and Fatima Saqib for their expert opinion and guidance throughout the experiment.
